

Instructions concerning metal zips

We thank you for your trust in products produced by YKK.

In order to assure you that products produced by YKK are manufactured to the highest standards, we would ask you to be aware that current textile manufacturing techniques can cause a change in the colour of the material covering elements of the zip, or can be a reason for discolouration or/and dirty of raised areas of the material.

We request therefore, that you aware of the following:

● **Pre-used materials:**

We ask that you use dry-clean only materials and/or pre-cleaned leather.

● **Production process:**

After the dyeing process or using chemical treatments, we request that you carefully rinse and dry the material.

● **Pressing:**

When pressing the material, we request that you cover the zip fastener with paper or fabric due to remaining paraffin wax on the elements of the zip.

● **Storage:**

We request that you do not pack or store products with zip fasteners in rooms with increased temperature or humidity or in tight foil packing materials.

We request that you do not pack or store damp products.

We recommend that you store the products in a ventilated place at room temperature.

Having been made aware of the principles listed above, we request that you carry out all necessary tests on our products before using any processes whatsoever.
